1) the sensing the condition of the system, determining a difference between first and second data value, determining a characteristic of a series of differences, comparing the characteristic to a threshold level, and generating an alarm beyond the threshold level is met by the monitoring system in which data values pertaining to conditions of monitored devices in the system are captured, analyzed, compared to thresholds, and indicated to users of the system via PC(12) accordance with instructions from a master control program(see: column 13, lines 9 et seq);

2) the series of differences is met by the conditionals as established by a user of the system which determine analyzed trends in the system(see: column 17, lines 15-52).
